

The key to *Activate Best Compositions*

Japan Compound CNC Auto Lathe MACHINING RANGE : $\varnothing 1\text{mm} \sim \varnothing 60\text{mm}$

Features :

High-Difficulty Operation
Of Lathe-Turning, Milling,
Drilling, Hinging, & Tapping.

Applications :

Fiber-Optic Electronic Parts,
Electronic Parts, Auto &
Motorbike parts, Light-Activated
Adapter, RAC Socket,
Plug, And Assemblies

YUH CHYANG HARDWARE INDUSTRIAL CO., LTD.

No. 56, Kung Ming S.1st Rd., An Nan Dist., Tainan City Taiwan

Yuh Chyang

Never Compromises on
Strict Quality Control

<http://www.yuhchyang.com.tw>

Founded in 1991, Yuh Chyang is an ISO/TS 16949 certified company. Over 10 years ago, it transformed its traditional manufacture to CNC precision hardware of special materials (mainly including stainless steel, carbon steel, steel, aluminum, copper, titanium). Stainless steel represents over 70%. The processing of automotive engine parts is its main revenue source and major customers are European carmakers. Product categories include metal forming, spare parts, connectors, electronic and electric components, communication parts, CNC lathes, computer parts, and a small amount of medical parts. 100% products are for export and the inventory turnover is about $\pm 5\%$. Europe is its major market (over 80%). Other markets include North America, Asia, the Middle East, and the Oceania. Through long-term cooperation, President Tsay-Sheng Tzeng thinks, European customers do not love to socialize and are practical. "Even you don't know how to produce the products

they demand, they will teach you how to do," Tzeng praises his European customers.

Yuh Chyang prefers the long term contracts from factories because "they show higher stability and loyalty." Tzeng adds, although long-term cooperation with factories can generate better profits, the requirement for delivery time and quality can't be compromised since "quality is the only thing we care." Its products are all new types of products manufactured under the precise control and calculation of CNC facilities according to the demand of customers (even an experienced engineer cannot simply make.)

The later surface treatment like polishing is executed by Yuh Chyang. Tzeng says smilingly, "We make products more sophisticated than standard screws, but earn less." The continuous innovation is the most important key in the competitive market. "Customers chose Yuh Chyang due to its high quality and innovation, so we receive nearly zero complaints from customers every year. That is why European customers love it." Although it is not a large-scale company and has only over 20 staff, it cares about the QC department a lot (50% of its staff are in QC department). Tzeng adds, its QC staff have to pass strict recruitment and have abundant backgrounds of QC. After that, they will be trained according to their level and have to completely know how to operate the precision testing and inspecting machines. QC staff are elites of the company. In addition, it also requires their in-house workers in the production lines or even packaging staff to know how to examine products and can pick up the defective ones at the moment. "Even staff in charge of processing scrap materials are trained to be able to categorize products." The motive behind the strict QC is the insistence on quality and the 100% responsibility for customers' requirement.
